This strange little compendium of self-published notions describing Benoit Mandelbrot's™s conception of fractals was enjoyable to read and provided some information to a non-mathematician about the idea of fractals. There was some heavy reliance on formulas that require advanced mathematics to interpret. Those readers (like myself) have to skim over them and get to the principles that Mandelbrot had in mind. It is about bringing order to chaos. Most everything material in the world is in a state of constant flux and seemingly immeasurable. At least it cannot be formulated in traditional ways. Mandelbrot set to creating mathematical formulae that would organize fluctuation into comprehensible terms. And to that end create beautiful structures such as snowflakes. The authors used the over written and trite example "how does one determine the length of the coast of Great Britain?" I used to know how to do that without understanding fractals. You begin with a ball of string that is many thousands of miles long. Then you walk along the coast and unravel the string, securing it at different sequences and once you circumnavigate the land and return to your starting point you simply clip the string from its ball and roll it up into its own ball. You unravel that and measure its length. Voila! it would seem until someone questioned at which tide was the measurement taken? The concept of "fractals" was introduced in 1868 by Felix Hausdorff. It is from the Latin, fractus or "break into irregular fragments". It was Mandelbrot who took the notion to its completeness prior to dying about 4 years ago. He spearheaded a movement to rearrange the idea of Chaos Theory popularized in the book Chaos by James Gleick, into "Complexity Theory".
